Apostolic Prefecture of West Bengal The Apostolic Prefecture of West Bengal was a Latin pre-diocesan missionary ecclesiastical jurisdiction in the present day Indian state of West Bengal. History The mission of the Roman Catholic Church in Bengal was begun by Mariano Rota, a Spaniard who was ordained as the first Vicar Apostolic of Bengal in 1816, the territory of which comprised Bengal and the provinces of Bihar, Orissa and Assam. Episcopal successively, Rota was succeeded by Domenico Tavaré, O.F.M., who was consecrated Bishop of Lipari on 4 December 1846, then by Edward Tighe, who was appointed Bishop of the Diocese of Cuttack-Bhubaneswar on 5 January 1857. On 25 May 1883, the Apostolic Prefecture of Bengal was established by Pope Leo XIII for the Roman Catholic Diocese of Calcutta, which comprised the entire area of the Bengal Presidency. In 1913, Pope Pius X decreed that the territorial prelature should be renamed the Apostolic Prefecture of Kolkata, an administrative change that was made in 1917. Its last bishop was John Joseph Callahan, who was appointed on 28 September 1939 and resigned the following day on the outbreak of World War II. The Apostolic Prefecture of West Bengal was suppressed, and its territory and assets, including churches and the grounds, were merged into the diocese of Calcutta. A conventional optical disk drive apparatus (hereinafter simply referred to as "disk drive apparatus") has an ejection mechanism for retracting and ejecting an optical disk with respect to a disk drive unit. For example, a conventional disk drive apparatus includes an ejection unit in which a plurality of buttons (ejecting keys) is arranged on a housing. Each of the buttons is associated with a mounting portion of a slide shutter which is arranged so as to slide in an ejection direction. The slide shutter is urged by a biasing unit in a direction away from the mounting portions (ejecting key side) and toward an ejecting key side. A pressing plate is used for pressing the slide shutter when any of the buttons is pressed. A structure of a conventional ejection unit is shown in FIGS. 6A and 6B. FIG. 6A is a sectional view showing the structure of the conventional ejection unit, and FIG. 6B is an enlarged view of a central portion of the ejection unit. In the ejection unit 50, a plate-shaped top cover 51 made of resin having an opening is attached to a housing 59 via a pair of side walls 58a. A slide shutter 52 is fitted into the housing 59 to be slidable in an ejection direction and is urged by a biasing unit 53 in a direction away from the housing 59 toward a key side. A rib 53a is formed on a surface of the slide shutter 52 at the key side. When an ejecting key 54 is pressed, the rib 53a comes into contact with a pressing plate 55. A chamfered portion 57 is formed in each side wall 58a so as to extend to the bottom of the side wall 58a. A guide groove 57a is formed along a longitudinal direction in the chamfered portion 57. A configuration of the guide groove 57a is shown in FIG. 6A. The guide groove 57a has a V-shaped cross-section. The ejection unit 50 is formed in the following manner. First, a mold is prepared with a molding die having a rib 51a formed in a shape corresponding to the rib 53a, a pair of side walls 58a, and the guide grooves 57a formed in the side walls 58a. The slide shutter 52 is fitted into a core of the mold so that the slide shutter 52 is rotatable. Then, the slide shutter 52 and a resin top cover 51 which is
